

Network Setup Recommendations

1. network

- a. all computers have to be on the same network name
- b. set the main computer (server) that contains the database to a static IP address
- c. be careful adding internet security and or firewalls to the system, especially the main computer (server), if there is one, make sure port 3306 is open!

2. printers

- a. share all printers that are being used for the system
- b. add all those printers to each computer's setup on this network so they can be used

3. folders

- a. set up two computers on the network, that don't contain the database and add a folder under the c:\ drive and name it "mysqldumps"
- b. share this folder on the computer
- c. map (!) these two folders to the main computer (server), so they can be accessed from there all the time
- d. one one computer, most likely the main computer (server), is a folder that contains the images, share this folder
- e. map (!) this folder to all other computers on the network
